

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

1-16. (canceled)

17. (currently amended) A process for the production of smoke adapted for smoking foodstuffs, said smoke being obtained by pyrolysis of an organic material, said process comprising:

- introducing said organic material to be pyrolyzed into a pyrolysis reactor comprising a heatable chamber substantially sealed, containing at least one ascending tubular element that is vibrated and receiving said organic material, wherein the tubular element or elements comprise a heating device to electrically heat the organic material by the Joule effect, and wherein said organic material being introduced at the level of the lower portion of said tubular element,

- directly heating said organic material with the tubular element or elements, in said chamber at a temperature comprised between 300°C and 400°C so as to produce pyrolysis during its movement, under the effect of vibrations, in the ascending tubular element or elements, and

- extracting the consumed organic material and the produced smoke at the level of the upper portion of said tubular element or elements.

18. (previously presented) The process according to claim 17, wherein the tubular element or elements are given a vibratory movement having a horizontal and/or vertical component.

19. (previously presented) The process according to claim 17, wherein the organic material is dried by preheating before it is pyrolyzed.

20. (previously presented) The process according to claim 17, wherein the smoke produced is condensed at the outlet of the reactor in a suitable condensation device.

21. (previously presented) The process according to claim 17, wherein at least one portion of the pyrolysis gas present at the outlet of the condensation device is re-injected into the reactor.

22. (previously presented) The process according to claim 17, wherein pyrolysis takes place under strict control, to about 0.1%, of the volume content of oxygen in said reactor.

23. (currently amended) The process according to claim 17, wherein pyrolysis takes place under precise control, to about one degree ~~Celeius~~ Celsius, of the temperature prevailing in said reactor.

24. (previously presented) The process according to claim 17, wherein the pyrolyzed organic material consists essentially of woodchips.

25. (previously presented) The process according to claim 17, wherein the pyrolyzed organic material consists essentially of fibers or chips of at least one vegetable substance.

26-29. (canceled)

30. (currently amended) A process for producing liquid smoke flavor, comprising:

- introducing organic material to be pyrolyzed into a pyrolysis reactor,

- directly heating said organic material with ~~[[the]]~~ a tubular element or elements comprising a heating device to electrically heat the organic material by the Joule effect, in said reactor at a temperature comprised between 300°C and 400°C so as to produce pyrolysis under the effect of vibrations, and

- extracting consumed organic material and said liquid smoke flavor.

31. (previously presented) The process according to claim 30, wherein the organic material is dried by preheating before it is pyrolyzed.

32. (previously presented) The process according to claim 30, wherein pyrolysis takes place under strict control, to about 0.1%, of the volume content of oxygen in said reactor.

33. (previously presented) The process according to claim 30, wherein the pyrolyzed organic material consists essentially of woodchips.

34-36. (canceled)

37. (new) A process for producing liquid smoke flavor, comprising:

- introducing organic material to be pyrolyzed into a pyrolysis reactor, said pyrolysis reactor comprising at least one ascending tubular element that is vibrating and receives said organic material at the lower portion of said at least one tubular element,

- heating said organic material in said at least one ascending tubular element, wherein said at least one ascending tubular element comprises a heating device for heating said organic material, at a temperature of between 300°C and 400°C so as to produce pyrolysis as said organic material moves through said at least one ascending tubular element, and

- extracting consumed organic material and said liquid smoke flavor.

38. (new) The process according to claim 37, wherein said at least one ascending tubular element have a vibratory movement having a horizontal and/or vertical component.

39. (new) The process according to claim 37, wherein the organic material is preheated so as to dry said organic material before pyrolysis.

40. (new) The process according to claim 37, wherein pyrolysis takes place under strict control, to about 0.1%, of the volume content of oxygen in said reactor.

41. (new) The process according to claim 37, wherein the organic material consists essentially of woodchips.

42. (new) The process according to claim 37, wherein the heating device electrically heats the organic material by the Joule effect.

43. (new) The process according to claim 37, wherein said at least one ascending tubular element is vibrated in a horizontal and/or vertical motion, and wherein the heating device of said tubular element or elements electrically heats the organic material by the Joule effect.
